

Rush Jewels Premium System

Comprehensive User Manual & Operational Guide

Welcome to the Rush Jewels Consolidated Management Platform. This operational manual details every core enterprise module, its access controls, and systemic workflows required for day-to-day high-end retail, wholesale, and inventory operations.

1. SYSTEM ACCESS & USER ROLES

The platform implements strict Role-Based Access Control (RBAC) to support task isolation, maintain secure audit logs, and protect financial transaction records.

USER ROLE	SYSTEM ACCESS & OPERATIONAL PERMISSIONS
Admin	Full administrative system access, core company configurations, comprehensive activity logs, database backups, and permission overrides.
Manager	Granular access to active inventory management, sales tracking, point-of-sale (POS) control panels, HR approvals, and periodic financial summaries.
Accountant	In-depth financial reporting and general ledgers, corporate bill approvals, credit note issuance validation, and monthly payroll processing pipelines.
Cashier	Exclusive localized access to the interactive POS checkout environment, transaction entry, payment acceptance, and immediate physical/digital receipt printing.
Employee	Self-service dashboard access to view upcoming shift rosters, check historical clock-in/out attendance metrics, submit formal leave requests, and track daily operational tasks.

2. SALES & POS (POINT OF SALE)

Manage standard retail front-counter workflows and large-scale wholesale distributions through the integrated, multi-state POS module.

POS SESSION MANAGEMENT

All active cash registers require open, active tracking instances to enforce end-of-day balances and transaction accountability.

1. Navigate to the left sidebar and select **Sales** → **POS Registers**.
2. At the start of a shift, click the **Open Register** button and type in the opening physical cash balance.
3. To secure data trails during breaks or temporary register absences, click **Pause Session**.
4. At the end of a shift, click **Close Register**, input all actual physical closing cash amounts, verify the calculated discrepancies, and submit the final shift report.

CHECKOUT FLOW (RETAIL & WHOLESALE)

1. Open the **POS Terminal** from the main application sidebar.
2. Select an existing profile via the **Customer Lookup** field, or click to add a new profile utilizing their full name and unique phone number.
3. Configure the transaction channel: Select either **Retail** or **Wholesale**. Choosing Wholesale applies the wholesale discount framework defined globally inside the catalog.
4. Add cataloged jewelry pieces to the cart. For premium items tracked explicitly by individual serial number: select the exact **Jewelry Serial Number(s)** from the live dropdown menu.
5. Click **Proceed to Payment**, designate split rules (Cash, Card, or Installment plans), and click **Complete Checkout**.

Upon completion, the transaction locks, an invoice PDF triggers automatically, and an automated SMS goes to the customer containing a public link to their hosted digital invoice and warranty passport.

3. INVENTORY & STOCK CONTROL

Maintain live tracking parameters across physical showrooms, back-office safes, raw material storage, and external production pipelines.

CATALOGING JEWELRY ITEMS

1. Go to **Inventory** → **Products** and select **Add Product**.
2. Fill out standard product fields: Product Name, Category, Brand, Base Price, and standard Warranty Period (Months).
3. Designate the specific operational **Type**:
 - **Trading**: standard readymade stock items bought and resold directly.
 - **Manufactured**: custom items engineered completely or assembled in-house.
 - **Service**: professional jewelry repairs, cleaning, polishing, or custom resizing.
4. Save the form to generate a global internal Product SKU and standard inventory barcode.

RECEIVING STOCK (GRN REGISTRY)

1. Navigate to **Purchasing** → **Goods Receipt Notes (GRN)**.
2. Click **New GRN**, then pick the verified Supplier and the specific receiving destination Warehouse.
3. Add incoming products; type or laser-scan the exact **Serial Numbers** for every unique item.
4. Click **Approve & Receive** to officially update active inventory pools across systems.

4. WARRANTY & AUTHENTICITY SYSTEM

Rush Jewels runs a real-time, dual-channel validation framework protecting against brand counterfeiting and managing customer support tracking.

PUBLIC WARRANTY LOOKUP (FOR CUSTOMERS)

Customers can verify items independently via the public interface endpoint: `/public-warranty-check`. By inputting either the unique Jewelry Serial Number or the corresponding Invoice Number, the portal returns the original metadata, verifying item authenticity and displaying active status timelines or expiration alerts.

WARRANTY REGISTRY & ACTIVATION (FOR STAFF)

Staff can override parameters or perform back-office tasks through the restricted endpoint: `/warranty-registry`.

1. Search the database using the unique **Jewelry Serial Number**.
2. Click the **Manage Expiry** action icon.
3. Toggle the active status between **Sold (Warranty Active)** and **In Stock**.
4. Define dates using the custom datepicker or use quick preset shortcuts (**6 Months, 1 Year, 2 Years**).
5. Save changes to commit them to the ledger.

5. CUSTOMER RETURNS & CREDIT NOTES

Handle items safely through structured Return Merchandise Authorization (RMA) logic to prevent inventory discrepancies and register errors.

CREATING A CUSTOMER RETURN (RMA)

1. Navigate to **Sales** → **Returns** and click **File Return Request**.
2. Select the customer profile, the target invoice, and the individual serial numbers being returned.
3. Choose the designated Return Reason (e.g., Defective, Exchange, Resize Request).
4. Check the **Auto-Restock** toggle if the piece is fit to return immediately to the active showroom.
5. Submit for review. Once authorized by an active Manager profile, select **Receive Items** to automatically update stock quantities.

ISSUING CREDIT NOTES

Once items are verified as received, click **Issue Credit Note** at the base of the RMA interface. The system generates an immutable code (e.g., **CN-0001**) preloaded with the balance. Cashiers can apply this code directly inside the POS terminal to offset balances during future purchases.

6. FINANCIAL REPORTS & ANALYTICS

Review real-time revenue splits, wholesale profitability, and overhead allocations across custom periods.

FINANCIAL SUMMARY

Navigate to **Reports** → **Financial Report** to view gross revenues, net wholesale margins, retail profit spreads, and overhead operational costs. Use the custom calendar widgets to segment data by specified performance dates.

AI PREDICTIONS

Navigate to the **AI Predictions** sub-dashboard to review algorithmically generated demand graphs, wholesale purchasing trend forecasts, and smart restock triggers derived from customer trends.

7. HR & PAYROLL MANAGEMENT

Track team attendance, construct shift schedules, and calculate monthly payroll balances seamlessly.

ATTENDANCE & SHIFTS

Staff use the main portal dashboard buttons to **Clock In** and **Clock Out** daily. Managers construct and publish comprehensive monthly shift rosters by navigating to **HR** → **Shifts**.

MONTHLY PAYROLL

1. Navigate to **HR** → **Payroll**.
2. Click **Generate Monthly Payroll** and select the target calendar month.
3. The payroll processor computes basic salary baselines, automatically aggregates tracked overtime (OT) hours, subtracts approved deductions, and builds individual, downloadable employee payslips.
